

- The login/register pages are quite simple and intuitive, hence the feedback to those was good. Though, a user commented that it might help to have some description of what grumblr is about. Also, Initially I had the username field and as a result, the rest of the pages were more similar to Twitter/Instagram in allowing users a fluid identity. However this field seems no longer useful since the full name is relevant enough; hence I will be removing it for simplicity and clarity.
- Initially I had three tabs "Home", "Profile" and "Stream". Home (1) with user info and user's posts. Profile (2) with user info, about, followers etc. and posts. Stream (3) with simply posts from people the user is following. This confused users a little bit, since "Home" is usually like the Newsfeed; and also here tab (1) and (2) are pretty similar.

Hence in the revised design, I only have two tabs - Home and Profile. Home for the stream of posts. Profile for both user info and user posts. This way there is consistency when any user's profile is viewed.

- For individual posts, I revised some designs on deleting, disliking and commenting on posts. Talking to users helped figure out some visual hierarchy, and most of the actions are moved now to the bottom of the post so that users can see the post first before taking any action. Other feedback was useful in figuring out information vs action - such as showing how many people disliked a post but also allowing a user to do that. Initially I used the same icon to do both; now they are separated out. "How many" is indicated by text, and an icon button is used for the "action".
